1.0 INTRODUCTION

This document is the final test report for the qualification of the gritblast assembly and process for the Inside Diameter of the RSRM Forward and Aft domes. Testing was performed in accordance with Controlled Test Plan (CTP) 0311.

2.0 TEST OBJECTIVES

The objectives of this qualification test were to:

- A. Certify that the gritblast assembly maintains the surface exposure rate proven to produce an acceptable blasted surface on the ID of the forward and aft domes.
- B. Certify that the blast pressure is kept within the specified parameters.
- C. Certify that the gritblasting process will be accomplished using standards of workmanship which are consistent with the performance and reliability requirements.

2.1 PASS/FAIL CRITERIA

The following pass/fail criteria must have been met in order to have a successful qualification test.

- A. A surface exposure rate of between 32.3 surface ft/min to 45.2 surface ft/min. is maintained through the entire cycle.
- B. The blast pressure is maintained at 80 psi \pm 5 psi during the entire gritblast cycle. An excursion from this parameter while the blast tank is cycling is acceptable.
- C. Erosion from the new gritblast assembly shall be less than 0.207 mils per pass.
- D. The surface roughness of the ID of the forward dome shall be greater than 70 microinches R_a after completion of one gritblast cycle.
- E. The surface roughness of the ID of the aft dome shall be greater than 70 microinches R_a after completion of one gritblast cycle.

3.0 EXECUTIVE SUMMARY

3.1 SUMMARY

This gritblast assembly shall be used when refurbishing the Inside Diameter (ID) of RSRM forward and aft domes. Initial blasting is used to remove corrosion and adhesive not removed during the insulation washout. Final blasting is conducted just prior to part finalization in order to remove residual contamination and prepare the ID surface for bonding.

The media used in this gritblaster is DuPont Zirclean Blasting Abrasive. It is possible to use other media in this gritblast assembly. However the only facility that has the control capability for this assembly is the Zirclean blast booth. This blast booth can not use other media without the occurrence of contamination.

This automated process shall replace the manually controlled gritblasting that is currently in operation. Manual gritblasting does not provide the consistency, control, and safety that an automated process is capable of delivering.

3.2 CONCLUSIONS

<u>Test Objective</u>	<u>Conclusion</u>
A. Certify that the gritblast assembly maintains the surface exposure rate proven to produce an acceptable blasted surface on the ID of the forward and aft domes.	Certified. The surface exposure rate was kept within the parameters specified in the pass/fail criteria.
B. Certify that the blast pressure is kept within the specified parameters.	Certified. The blast pressure was kept within the parameters specified in the pass/fail criteria.
C. Certify that the gritblasting process will be accomplished using standards of workmanship which are consistent with the performance and reliability requirements.	Certified. Test results show that the automated gritblaster produces a better surface finish than the current manual gritblast method.

3.3 RECOMMENDATIONS

It is recommended that the gritblast assembly and process be qualified for refurbishment operations on the inside diameter of the RSRM forward and aft domes.

4.0 INSTRUMENTATION

The instrumentation that was needed for this qualification test is listed below:

<u>Instrument</u>	<u>Purpose</u>
DigiSolver E5N / Autotech Corp.	Measure the blast nozzle arm speed
DigiSolver E6N / Autotech Corp.	Measure the rotational speed of the table
Pressure Transducer / Omega Model: PX700-200G1 Range: 0-200 PSIG	Measure the blast system air pressure
Programmable Logic Controller 700 / Square D	Monitor the speed of the table rotation and the blast arm speed, compare actual values to the programmed set point, and adjust the signal to the variable speed DC electric motors to maintain the programmed set point
Surtronic-10 surface analyzer	Measure the surface roughness of the gritblasted surfaces. This instrument provides a microinch R_a surface roughness measurement within ± 3 microinch accuracy. Operating instructions are available in document No. DI-1012.
Mettler AE-160 electronic balance scale	This instrument shall be used to weigh all coupons before and after gritblasting. The weight loss is used to calculate erosion. This instrument has a weighing range of 0 to 160 grams, accurate to 0.1 milligrams.

5.0 PHOTOGRAPHY

Still photographs of the test items were taken just prior to the qualification test. Copies of the photographs (series no. 128687, 129073, and 129138) are available from the Thiokol Corporation Photographic Services Department.

6.0 TEST DESCRIPTION

Fifty bare metal D6AC steel coupons (2" x 2" x 0.25") were attached to the ID of the forward dome and fifty to the ID of the aft dome using black vacuum putty. These coupons were weighed before and after gritblasting to determine the erosion rate of the new gritblast assembly. The surface roughness of the dome surface adjacent to each coupon location was also measured before and after testing.

The non-flight domes used in this test (1U51633-06, 1U51633-05) were attached to a rotating table that is connected to the base of the gritblast assembly. This table is driven by a variable speed DC electric motor. At the center of the table is the blast nozzle arm that rotates about a plane that is oriented 90° from the plane of the rotating table. This blast arm is driven by variable speed DC electric motors. The programmable logic controller is used to control the speed of the rotating table and the blast nozzle arm so that a constant exposure (surface ft/min) to the blast is maintained.

After being rolled into the blast booth, the gritblast assembly was connected to the automated control system. One complete cycle was run for each dome without using any grit media (dry run). After the dry run verified the operation of the gritblast assembly, a complete cycle was run for each dome using the grit media. Operational parameters (blast pressure, rotational speed, etc.) were monitored every five seconds to ensure that the gritblast cycle was performing as intended.

7.0 RESULTS AND DISCUSSION

7.1 FORWARD DOME

All pass/fail criteria outlined for the forward dome in section 2.1 of the test plan (CTP-0311) were successfully accomplished.

The surface exposure rate for the forward dome blast cycle is shown in Figure 1. The figure indicates that the criteria for the surface exposure rate was violated at a nozzle position of approximately 106 inches. However this is not the case, it should be noted that at this location the table and nozzle speeds are increasing at such

a fast rate that the logic controller can not update the readouts quickly enough. The programmed rotational speed of 7 RPM (at the end of the cycle) was verified using a digital tachometer. The surface exposure rate was maintained within the 32.3 - 45.2 surface ft/min range during the entire gritblast cycle..

Table 1 shows the blast pressure in five second intervals during the forward dome gritblast cycle. The blast pressure did not deviate from the pressure range of 80±5 psi specified in the test plan.

Analysis of the D6AC steel coupons after completion of the blast cycle showed that there was an average erosion rate of 0.167 mils/pass. This erosion rate is within the 0.207 mils of erosion per pass outlined in the pass/fail criteria.

Surface roughness for the dome surface adjacent to the coupons is listed in Table 2. The pass/fail criteria for post-test surface roughness values was successfully achieved. There were no dome surface locations that had a surface roughness less than 70 microinches R_a .

Photographs showing the pre-test and post-test condition of the forward dome are shown in figures 2 and 3.

7.2 AFT DOME

All pass/fail criteria outlined for the aft dome in section 2.1 of the test plan (CTP-0311) were successfully accomplished.

The surface exposure rate for the aft dome blast cycle is shown in Figure 4. The exposure rate was maintained within the 32.3 - 45.2 surface ft/min range specified in the pass/fail criteria.

Table 3 shows the blast pressure in five second intervals during the aft dome gritblast cycle. The blast pressure did not deviate from the pressure range of 80±5 psi specified in the test plan.

Analysis of the D6AC steel coupons after completion of the blast cycle showed that there was an average erosion rate of 0.173 mils/pass. This erosion rate is within the 0.207 mils of erosion per pass outlined in the pass/fail criteria.

Surface roughness for the dome surface adjacent to the coupons is listed in Table 4. The pass/fail criteria for post-test surface roughness values was successfully achieved. There were no dome surface locations that had a surface roughness less than 70 microinches R_a .

Photographs showing the pre-test and post-test condition of the aft dome are shown in figures 4 and 5.
